

SPRINT 2

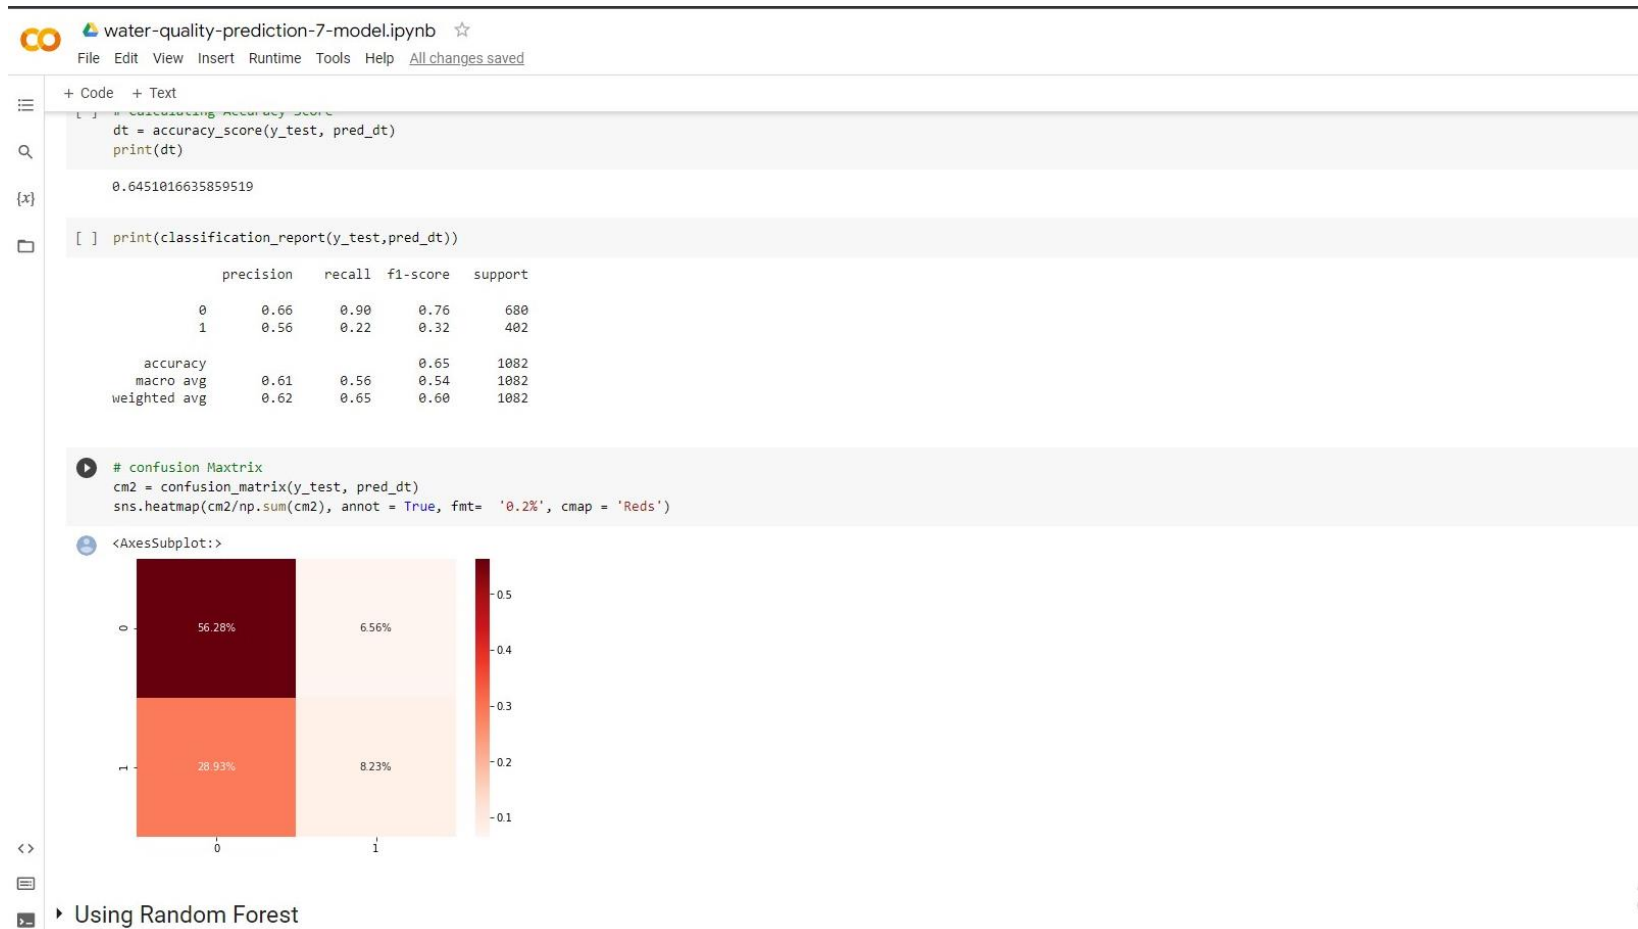

PROJECT DELIVERABLES (Model building & Evaluation)

Team ID	PNT2022TMID28413
Project Name	Efficient Water Quality Analysis & Prediction using Machine Learning

LOGISTIC REGRESSION EVALUATION:

DECISION TREE EVALUATION:

The image shows a Jupyter Notebook titled "water-quality-prediction-7-model.ipynb". The notebook contains two code cells. The first cell calculates the accuracy score of a decision tree model, resulting in 0.6451016635859519. The second cell prints the classification report, which shows precision, recall, f1-score, and support for two classes (0 and 1). Below the report, a confusion matrix is generated and visualized as a heatmap. The heatmap shows the counts of true positives, true negatives, false positives, and false negatives. The color scale ranges from 0.1 (light orange) to 0.5 (dark red).

```
dt = accuracy_score(y_test, pred_dt)
print(dt)

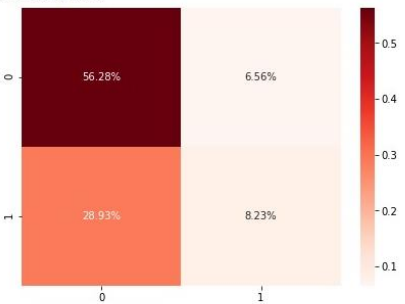

0.6451016635859519

[ ] print(classification_report(y_test, pred_dt))
```

	precision	recall	f1-score	support
0	0.66	0.90	0.76	680
1	0.56	0.22	0.32	402
accuracy			0.65	1082
macro avg	0.61	0.56	0.54	1082
weighted avg	0.62	0.65	0.60	1082

```
# confusion Maxtrix
cm2 = confusion_matrix(y_test, pred_dt)
sns.heatmap(cm2/np.sum(cm2), annot = True, fmt= '0.2%', cmap = 'Reds')
```

<AxesSubplot:>

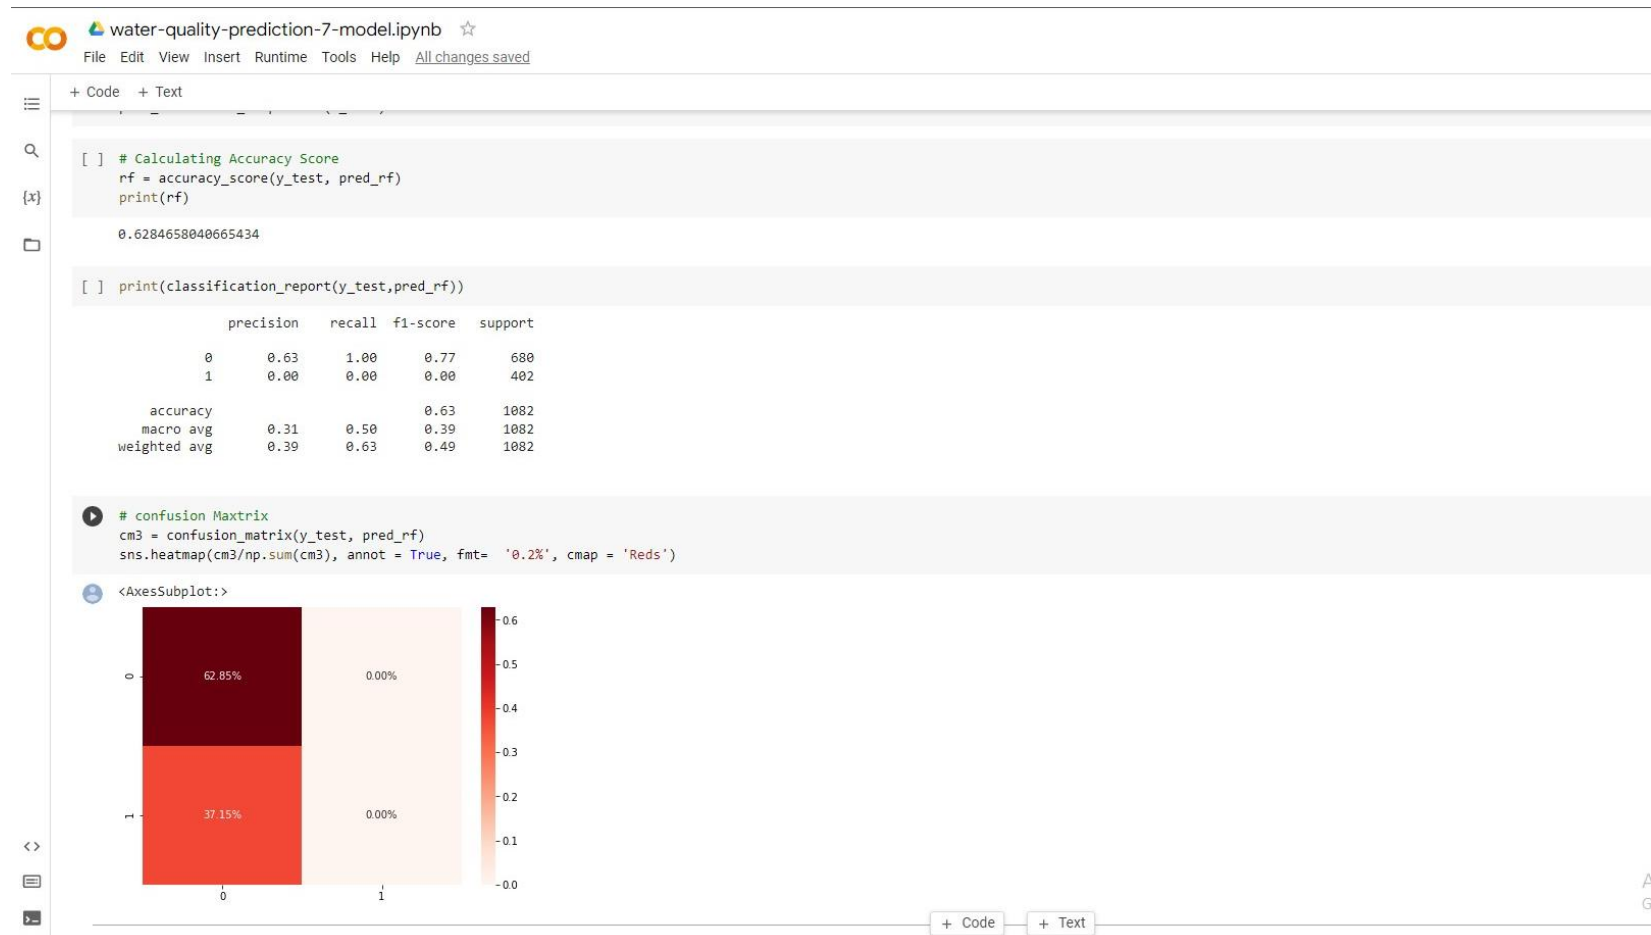

The heatmap displays the confusion matrix for the decision tree model. The x-axis represents the predicted class (0, 1) and the y-axis represents the actual class (0, 1). The color scale ranges from 0.1 (light orange) to 0.5 (dark red). The values are as follows:

	0	1
0	56.28%	6.56%
1	28.93%	8.23%

Using Random Forest

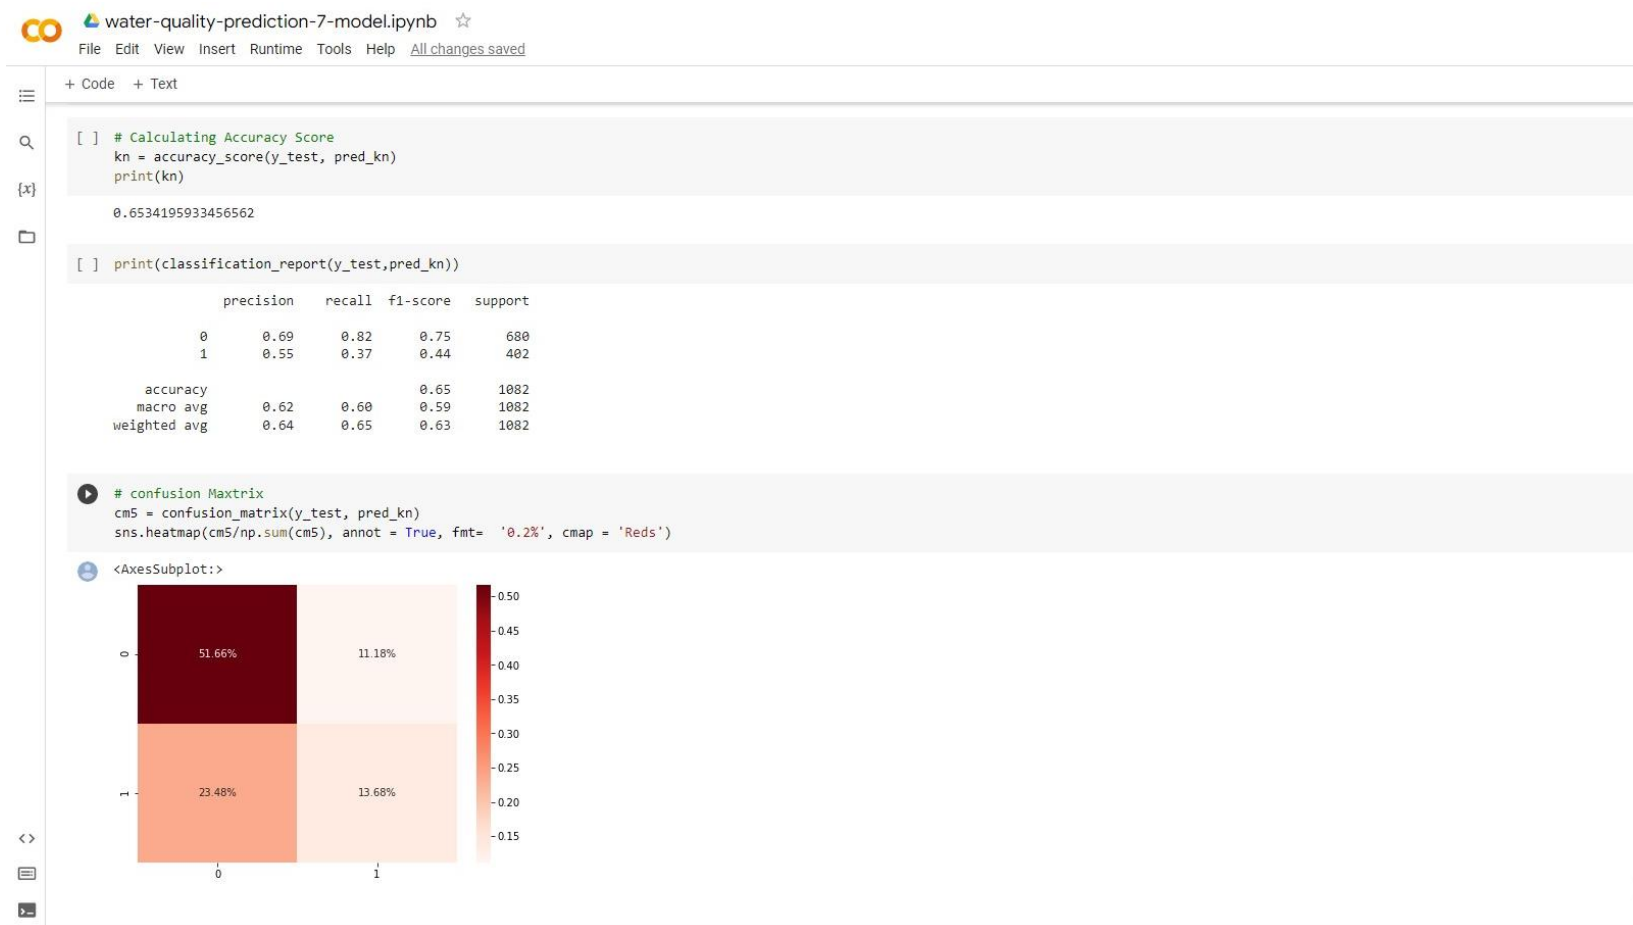

RANDOM FOREST EVALUATION:

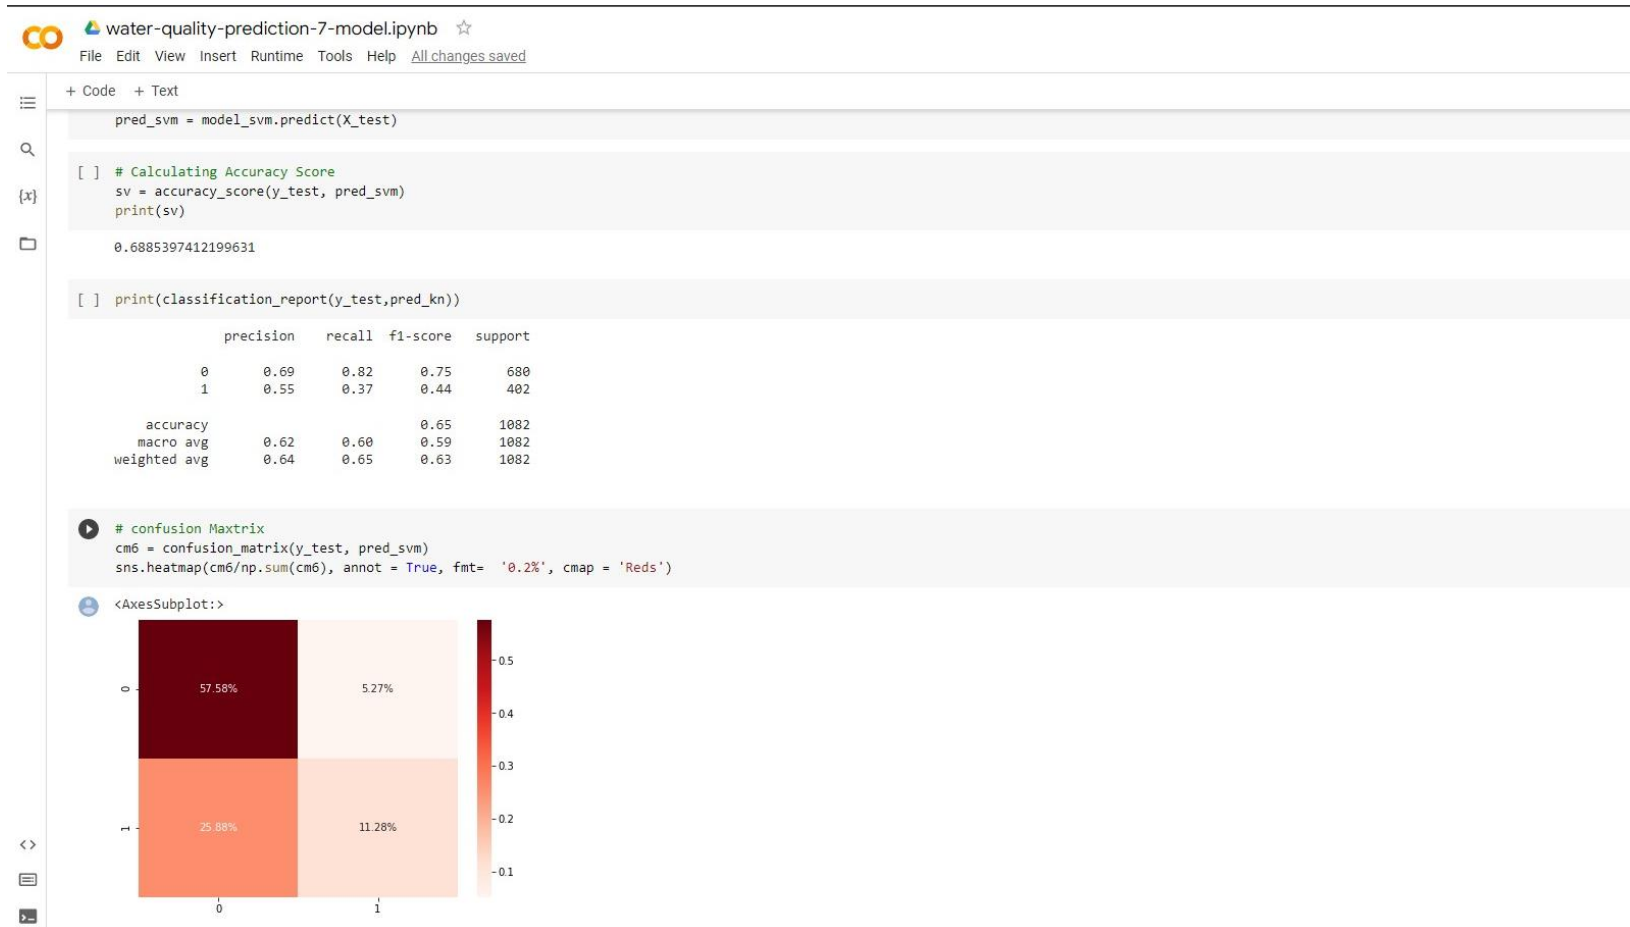

XGBOOST CLASSIFIER EVALUATION:

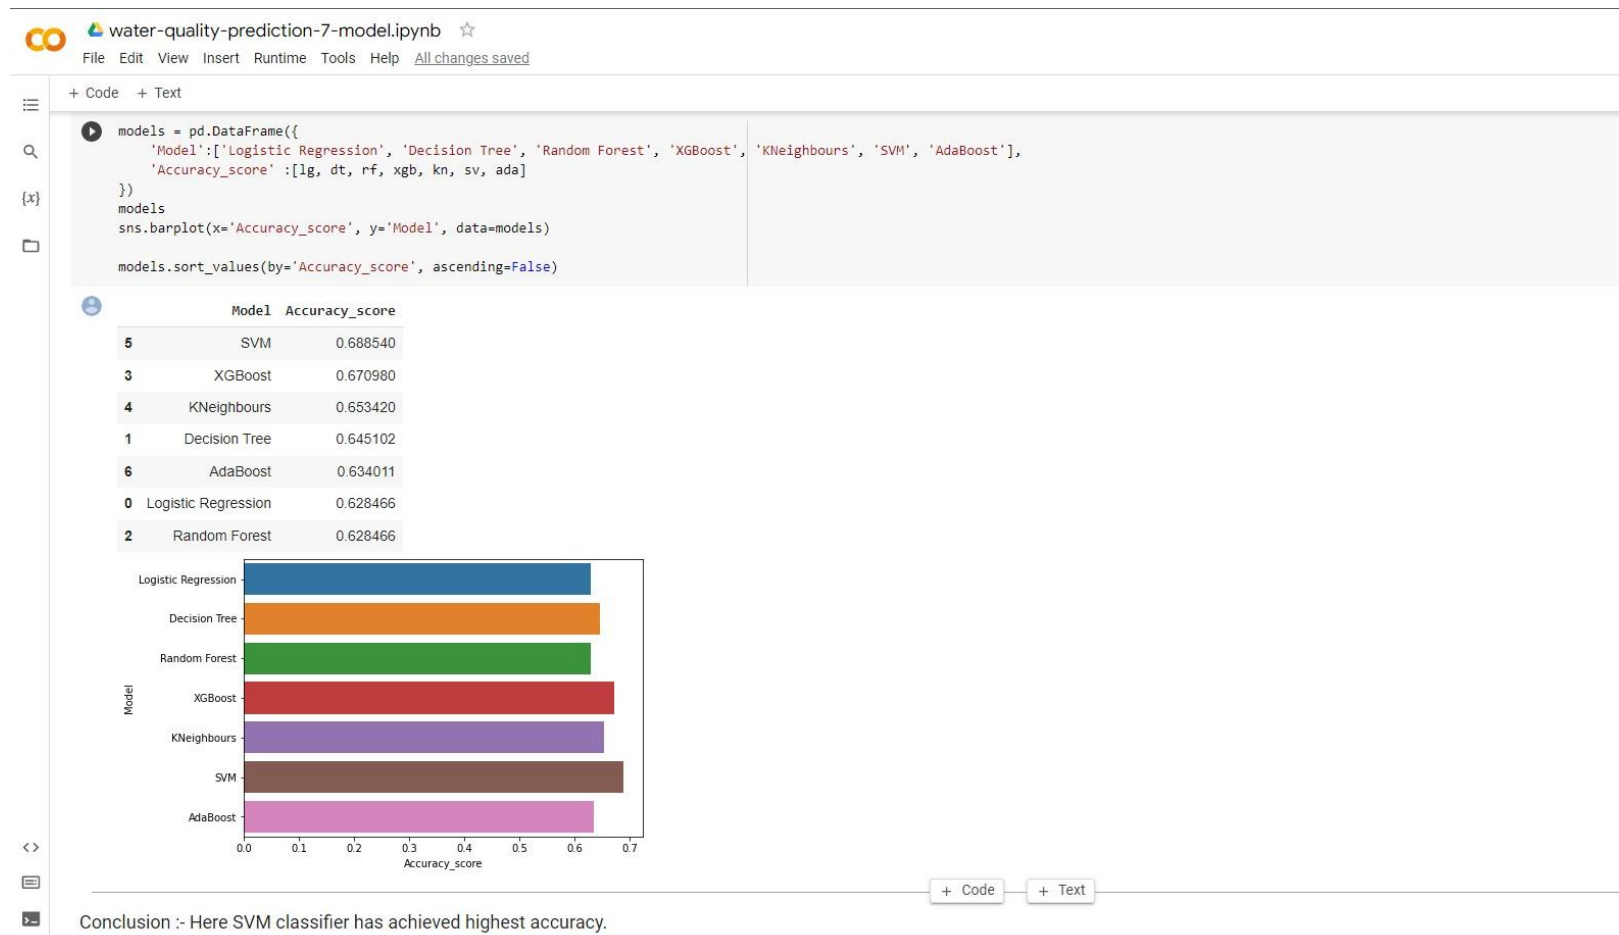

KNN EVALUATION:

SVM EVALUATION:

COMPARISSON:

CONCLUSION:

Out of all we found that *SVM Classifier* has the highest accuracy among all, so we are going to use *SVM Classifier* to train our Water Prediction machine learning model.
